

ReserveChain.io

THE INFRASTRUCTURE FOR REAL-WORLD ASSETS.

FINAL COMPLETE DEVELOPER INSTRUCTIONS

ReserveChain.io Complete Technical Ecosystem

Website, Token, Backend, Portals, iOS/Android Apps, Whitepaper, Deployment and Handover

Document Reference	RC-MASTER-DEV-002
Version	2.0
Date	19 July 2026
Status	Final Master Scope for Developer Implementation
Classification	Confidential - Developer Use Only
Project Stage	Swiss Corporate and Issuance Structure in Development
Scope Relationship	Consolidated website and complete technical ecosystem scope

Binding Scope

This document constitutes the consolidated formal, technical and functional scope for the ReserveChain.io prelaunch website and complete technical ecosystem, including the token, backend, portals, mobile applications, whitepaper, deployment, documentation, training and handover. It supplements and does not reduce or replace the Final Master Development Instructions, project description, attachments, accepted proposal, milestone terms or subsequent written instructions.

TABLE OF CONTENTS

1. Core Language Rules	2. Project Positioning and Design Direction
3. Initial Website Build and Prohibited Content	4. Mandatory No-Offer Disclosure
5. Regulatory and Jurisdictional Preparation	6. Required Navigation and Website Pages
7. Recommended Homepage Copy	8. How the Proposed ReserveChain Model Will Work
9. Industrial Metals Asset System	10. Copper Powder Program Requirements

13. Illustrative Asset Placeholder	14. Whitepaper and Documentation Centre
15. Functional Waitlist and Enterprise Enquiries	16. Content Status, Audit Trail, CMS and Security
17. Modules to Prepare but Keep Inactive	18. Website Modes
19. Technical Quality, SEO, Privacy and Monitoring	20. Environments, Backups, Ownership and Handover
21. Content Handover Guide	22. Functional Acceptance Criteria

PURPOSE AND STATUS

ReserveChain is currently completing its Swiss corporate, legal and issuance structure. The final ownership arrangements, custody agreements, industrial-metal documentation, laboratory reports, valuations, insurance, token structure, reserve calculations, redemption terms and offering conditions remain subject to final confirmation.

The website must be developed as a professional institutional pre-launch platform for project information, enterprise enquiries and registration of interest. It must not present ReserveChain as a fully operational token-sale, trading, investment or physical-redemption platform until those functions are formally approved and activated.

Where owner-supplied or third-party information remains pending, the developer must still create the required configurable module, workflow, data field, document area and administrative control.

1. Core Language Rules

During the pre-launch stage, the website must not state or imply that the following are already operational unless documentary evidence has been supplied and publication has been expressly approved:

- Legal ownership rights represented by tokens.
- Issued or circulating tokens.
- Final tokenomics.
- Active presale or token purchase.
- Independent ownership verification.
- Final laboratory verification.
- Professional custody.
- Segregation of the industrial metals.
- Insurance coverage.
- Proof of Reserves.
- Secondary-market trading.
- Guaranteed liquidity.
- Physical redemption.
- Transfer of legal title.
- Regulatory authorization.
- Confirmed commercial partners.

Use neutral and accurate language such as:

- Proposed.
- Planned.
- In development.
- Intended.
- Subject to final legal review.
- Subject to documentary verification.
- Subject to final custody arrangements.
- Subject to final insurance arrangements.
- Subject to definitive token and offering documentation.
- Subject to final technical implementation.
- Subject to jurisdictional eligibility.

Sections titled Verification, Custody, Proof of Reserves, Tokenization, Trading and Redemption must clearly state that they describe the proposed framework and remain subject to final legal, contractual, technical and operational confirmation.

Mandatory Browser Title

ReserveChain.io | Building the Infrastructure for Industrial-Metals Tokenization

2. Project Positioning and Design Direction

ReserveChain must be presented as an institutional infrastructure platform for tokenizing verified real-world industrial assets - not as a speculative cryptocurrency, meme token or generic presale website.

Initial Proposed Asset Programs

- Ultra-High-Purity Copper Powder - 99.9999%.
- High-Purity Nickel Wire - 99.9807%.

The architecture must also be expandable to future approved real-world asset programs.

Visual Direction

- Deep graphite, black or dark navy backgrounds.
- Controlled copper accents for the Copper Powder program.
- Nickel, silver or metallic-grey accents for the Nickel Wire program.
- Clean institutional typography.
- Premium serif or technical-display typography for major headings.
- Highly readable sans-serif typography for body text.
- Technical diagrams and structured data tables.
- Controlled animation.
- Strong spacing and visual hierarchy.
- Industrial laboratory, storage, material and logistics imagery.
- Fully responsive desktop, tablet and mobile layouts.

Avoid

- Excessive neon effects.
- Generic cryptocurrency coins.
- Meme-token imagery.
- Unrealistic vault or warehouse renders presented as actual facilities.
- Decorative claims that cannot be verified.

- Aggressive countdowns or presale urgency.
- Language promising returns, appreciation or liquidity.

3. Initial Website Build and Prohibited Content

The developer must not include:

- Unsupported portfolio values.
- Invented reserve values.
- Invented investor or token-holder numbers.
- Unsupported quantities of Copper Powder or Nickel Wire.
- Unsupported valuation figures.
- Unsupported laboratory results.
- Unsupported custody or insurance claims.
- Unsupported performance or appreciation statistics.
- Guaranteed returns or guaranteed liquidity.
- Risk-free investment statements.
- Buy now, Start investing or Join the presale language.
- Countdown timers.
- Active purchase buttons.
- Wallet connection in public pre-launch mode.
- Payment collection in public pre-launch mode.
- Token contract addresses that have not been formally approved.
- Third-party names or logos without authorization.

Do not replace removed or missing information with estimated, invented or fictitious information.

Required Provisional Asset Notice

Preliminary illustrative information only - subject to documentary verification, independent assessment and final approval. No asset or token is currently offered for sale through this website.

The final production website must operate under the official ReserveChain.io domain. Temporary deployment platforms may be used only for development and staging.

4. Mandatory No-Offer Disclosure

Display this notice prominently on the homepage, asset-program pages, waitlist page and documentation area:

Mandatory Disclosure

ReserveChain is currently in development. No tokens are being offered or sold through this website. Registration of interest does not constitute an investment, token purchase, asset reservation, price reservation, allocation of tokens or entitlement to participate in any future offering. Any future availability will be subject to the final legal and corporate structure, definitive offering documentation, asset verification, jurisdictional eligibility, KYC/KYB, sanctions screening and approval.

The final public wording remains subject to legal review.

5. Regulatory and Jurisdictional Preparation

ReserveChain does not intend to offer or sell tokens to residents or persons located in the European Union or European Economic Area.

Do not describe ReserveChain as MiCA-compliant and do not design the public website around MiCA marketing claims.

The architecture must support:

- Permitted-jurisdiction lists.
- Restricted-jurisdiction lists.
- Country-of-residence verification.
- Nationality capture when legally required.
- Current-location declarations when required.
- Jurisdiction-specific disclosures.
- KYC and KYB.
- AML controls.
- Sanctions and politically exposed person screening.
- Eligibility approval.
- Geographic access controls.
- Transfer restrictions.
- Accredited, professional or institutional classification where required.
- Prevention of participation through nominees, intermediaries or third parties seeking to bypass restrictions.
- Recordkeeping of eligibility decisions.
- Jurisdiction-specific token and redemption terms.

Final restrictions, classifications and public wording remain subject to legal approval.

6. Required Navigation and Website Pages

Main Navigation

- Home
- How It Works
- Industrial Metal Assets
- Copper Powder
- Nickel Wire
- Verification
- Custody
- Proof of Reserves

Hero Headline

Approved Copy

Building the Infrastructure for Tokenized Industrial Metals

Subheadline

Approved Copy

ReserveChain is developing an institutional platform intended to connect documented industrial-metal assets with digital tokenization, verification, custody and physical-redemption infrastructure. The corporate, legal, custody, asset-verification and technical arrangements are currently being finalized.

Corporate Status

Approved Copy

Swiss corporate and issuance structure in development.

Buttons

- Join the Project Waitlist
- Explore the Proposed Model
- View Industrial Metal Programs
- Request Enterprise Information

Microcopy

Approved Copy

Receive project-development updates and future eligibility information. Registration does not constitute an investment, token purchase or reservation of industrial metals.

Proposed Trust Bar

- Industrial Asset Verification Framework
- Custody Structure in Development
- Reserve Reconciliation Architecture
- Planned ERC-20 Infrastructure

8. How the Proposed ReserveChain Model Will Work

1. **Asset Program Selection** - ReserveChain intends to evaluate industrial-metal programs according to approved purity, ownership, documentation, valuation, storage, marketability and redemption criteria.
2. **Independent Material Verification** - Eligible material is intended to undergo appropriate laboratory testing, assay, inspection and documentary verification.
3. **Ownership and Custody Documentation** - Approved material is intended to be recorded through ownership documentation, warehouse or custody records, inventory controls and appropriate insurance arrangements.

4. **Digital Asset Passport** - Each approved lot, batch, container or coil is intended to receive a structured digital record connecting the physical material with its laboratory, ownership, valuation, custody and reserve documentation.
5. **Tokenization** - ERC-20 tokens or asset-program token series may be issued under the final legal, commercial and technical structure.
6. **Administration and Reserve Reconciliation** - The platform is intended to reconcile eligible physical inventory with issued and circulating tokens through controlled records and periodic verification.
7. **Transfer and Redemption** - Any transferability, secondary-market participation or physical redemption will be governed exclusively by the final token terms, eligibility rules, operational requirements and legal documentation.

9. Industrial Metals Asset System

Create a reusable asset-program, lot, batch, container and coil data model. The system must support separate records for:

- Asset program.
- Physical material.
- Lot or batch.
- Container.
- Coil.
- Warehouse or custody location.
- Laboratory report.
- Ownership documentation.
- Valuation.
- Token series.
- Reserve status.
- Redemption status.

Common Asset Fields

- Unique asset-program ID.
- Unique lot, batch, container or coil ID.
- Slug.
- Asset publication status.
- Asset availability status.
- Verification status.
- Custody status.
- Reserve status.
- Tokenization status.
- Redemption status.
- Material category.
- Product name.
- Material form.
- Manufacturer or producer.
- Supplier or asset owner.
- Country of origin.
- Country of manufacture.
- Production date.
- Acquisition or structuring date.
- Gross weight.
- Net weight.
- Weight unit.
- Number of physical units.
- Packaging type.
- Seal numbers.
- Container or coil identifiers.
- Storage location.
- Ownership records.
- Chain-of-title records.
- Laboratory reports.
- Inspection records.
- Custody records.
- Warehouse receipts.
- Insurance records.
- Valuation history.
- Price per kilogram or metric ton.
- Total indicative assessed value.
- Currency.
- Valuation methodology.
- Pricing benchmark or source.
- Media gallery.

- Videos.
- Supporting documents.
- Material-event history.
- Jurisdictional restrictions.
- Multilingual content.
- SEO metadata.
- Record versioning.
- Creation, review, approval and publication dates.
- Public, private and pending document visibility.
- Data-source references.
- Media usage rights.
- Alternative text.

Publication Control

All ownership, laboratory, custody, insurance and reserve claims must remain unpublished until the supporting evidence has been supplied and approved.

10. Copper Powder Program Requirements

The Copper Powder asset model must support:

- Product name.
- Purity percentage.
- Chemical composition.
- Impurity profile.
- Laboratory and report number.
- Testing methodology.
- Particle-size distribution.
- Minimum and maximum particle size.
- Average particle size.
- Morphology.
- Apparent density.
- Tap density.
- Oxygen content.
- Moisture content.
- Flow characteristics where applicable.
- Production method where documented.
- Batch number.
- Number of containers.
- Container type.
- Net weight per container.
- Total net weight.
- Seal number.
- Packaging condition.
- Storage requirements.
- Handling requirements.
- Safety documentation where applicable.
- Country of origin.
- Laboratory report.
- Certificate of Analysis.
- Warehouse or custody receipt.
- Ownership evidence.
- Valuation history.
- Proposed token-program information.
- Container-level redemption status.

Container-Level Control

The system must support container-by-container identification, inventory reconciliation and redemption controls where approved.

11. Nickel Wire Program Requirements

The Nickel Wire asset model must support:

- Product name.
- Purity percentage.
- Chemical composition.
- Impurity profile.
- Laboratory and report number.

- Testing methodology.
- Wire diameter.
- Gauge.
- Diameter tolerance.
- Coil length.
- Net coil weight.
- Number of coils.
- Total net weight.
- Surface finish.
- Temper or material condition.
- Tensile strength where documented.
- Elongation where documented.
- Electrical or thermal characteristics where relevant.
- Production batch.
- Coil identification number.
- Packaging method.
- Seal number.
- Storage requirements.
- Handling requirements.
- Country of origin.
- Laboratory report.
- Certificate of Analysis.
- Warehouse or custody receipt.
- Ownership evidence.
- Valuation history.
- Proposed token-program information.
- Coil-level redemption status.

Coil-Level Control

The system must support individual coil identification, inventory reconciliation and coil-by-coil redemption where approved.

12. Token and Valuation Controls

Do not hard-code:

- Token supply based directly on material valuation.
- A fixed token price.
- A fixed token-to-kilogram ratio.
- A fixed token-to-container or token-to-coil ratio.
- Ownership rights.
- Redemption thresholds.
- Presale discounts.
- Expected appreciation.
- Secondary-market liquidity.
- Contract addresses before deployment approval.
- Token symbols before final authorization.
- Circulating supply before issuance.
- Reserve ratios before reconciliation.
- Any right to physical title before legal approval.

The current project architecture specifies an ERC-20 structure on Ethereum, but all contract addresses, issuance parameters, token-series rules, supply, pricing and live status must remain configurable and unpublished until approved.

Required Token Field States

- Pending.
- Under Review.
- Not Applicable.
- Approved.
- Published.
- Suspended.
- Retired.

Derived values such as percentage allocated, percentage issued, circulating supply and reserve coverage must be calculated automatically from approved source data.

13. Illustrative Asset Placeholder

Field	Required Status / Value
Title	Illustrative Industrial Metal Asset Template

Field	Required Status / Value
Notice	This presentation demonstrates the future format of a ReserveChain industrial-metal asset page. No verified material, ownership document, laboratory report, valuation, custody arrangement, reserve claim or token is represented by this placeholder.
Material	Pending
Asset program	Pending
Purity	Pending
Lot or batch	Pending
Net weight	Pending
Laboratory verification	Pending
Ownership verification	Pending
Valuation	Pending
Custody status	Pending
Reserve status	Pending
Tokenization status	Not issued
Availability	Not offered for sale
Image text	Verified industrial-asset photography pending.

Do not display fictional asset quantities, purity reports, laboratory names, certificate numbers, ownership claims, warehouse locations, custodians, insurers, valuations, token prices, contract addresses or availability status.

14. Whitepaper and Documentation Centre

Do not publish a final whitepaper until the required corporate, legal, asset, custody, insurance, valuation, token and offering information has been approved.

Create:

- Whitepaper - In Preparation section.
- Preliminary Project Overview.
- Proposed whitepaper table of contents.
- CMS-managed document centre.
- Document categories.
- Document versions.
- Publication dates.
- Approval status.
- Public, private and pending visibility controls.
- Historical-document archive.
- Placeholders for corporate, legal, industrial-asset, laboratory, valuation, custody, insurance, reserve, token and technical documents.

Required Whitepaper Notice

The final ReserveChain whitepaper will be published following completion of the Swiss corporate and issuance structure, legal documentation, industrial-asset verification, custody and insurance arrangements, reserve reconciliation and technical implementation.

Do not display an inactive or misleading download button.

Future Document Categories

- Corporate Documents.
- Project Overview.
- Whitepaper.
- Token Terms.
- Risk Disclosure.
- Copper Powder Reports.
- Nickel Wire Reports.
- Certificates of Analysis.
- Ownership Documentation.
- Valuation Reports.
- Warehouse and Custody Records.
- Insurance Information.
- Proof-of-Reserves Reports.
- Smart-Contract Documentation.
- Smart-Contract Audit.
- Redemption Terms.
- Jurisdictional Restrictions.
- Privacy and Data Protection.
- Governance Reports.
- Material Events and Announcements.

15. Functional Waitlist and Enterprise Enquiries

Waitlist Fields

- First name.
- Last name.
- Email address.
- Country of residence.
- Individual or institutional interest.
- Industrial buyer interest.
- Asset-owner or originator interest.
- Material of interest: Copper Powder, Nickel Wire, Both or Future asset programs.
- Approximate interest range.
- Intended participation type.
- Consent to receive updates.
- Privacy acknowledgement.
- Confirmation that registration does not constitute an investment, purchase, reservation, allocation or entitlement.

Email-address verification must be completed before registration is treated as confirmed. Nationality and current-location fields must be technically supported but activated only when legally required.

Administrative Capabilities

- Search registrations.
- Filter by country.
- Filter by participant type.
- Filter by material of interest.
- Filter by approximate interest range.
- Filter by campaign source.
- Export records.
- Manage subscription status.
- Review consent records.
- Review registration source.
- Correct, anonymize or delete data under approved retention procedures.
- Add internal notes.
- Assign enquiries to authorized team members.

Prohibited Collection

No funds, payment details, wallet addresses or token reservations may be accepted through the waitlist.

16. Content Status, Audit Trail, CMS and Security

Publication States

- Draft.
- Under Review.
- Approved.
- Published.
- Unpublished.
- Archived.

Draft and under-review content must never be publicly accessible, indexed or exposed through public APIs. Previously published records must be unpublished or archived - not permanently deleted through the standard CMS interface.

Audit Trail

A complete append-only and tamper-evident administrative audit trail is mandatory. Audit records must not be editable or removable through the standard administrative interface.

- User.
- Date and time.
- Action.
- Record affected.
- Previous value.
- New value.
- Publication-status changes.
- Document uploads.
- Document replacements.
- Approval actions.
- Reason for material changes where required.

CMS Scope

- Homepage.
- Navigation.

- Footer.
- Asset programs.
- Copper Powder records.
- Nickel Wire records.
- Lots and batches.
- Containers and coils.
- Laboratory reports.
- Ownership records.
- Valuations.
- Custody records.
- Insurance records.
- Reserve reports.
- Media.
- Documents.
- FAQ.
- Team.
- Partners.
- Corporate information.
- Enterprise services.
- Asset-owner enquiries.
- Legal notices.
- Risk disclosures.
- Restricted jurisdictions.
- SEO.
- Translations.
- Waitlist.
- Contact enquiries.
- Website modes.
- Module visibility.

Administrator Security

- Role-based access control.
- Multi-factor authentication.
- Secure password requirements.
- Session expiration.
- Login-attempt protection.
- Administrator activity logs.
- Restricted access to confidential documents.
- Separation of editors, reviewers, compliance users and system administrators.
- Immediate account deactivation.
- No shared credentials.
- Secure environment-variable storage.
- Protection of API keys and service secrets.

17. Modules to Prepare but Keep Inactive

Prepare the complete technical structure, but keep it hidden, inactive and non-indexable until expressly authorized, for:

- Confirmed team profiles.
- Confirmed partners.
- Laboratories.
- Custodian.
- Warehouse facilities.
- Insurance provider.
- Legal and technical advisers.
- Industrial Metals Registry.
- Digital Asset Passports.
- Proof of Industrial Metal Reserves.
- Reserve reconciliation dashboard.
- Blockchain explorer links.
- Tokenomics.
- Smart-contract information.
- KYC/KYB.
- AML and sanctions screening.
- Jurisdictional eligibility.
- Wallet connection.
- USDT ERC-20 payments.
- Token purchase.
- Investor portal.
- Enterprise client portal.

- Asset-owner/originator portal.
- Token holdings.
- Transaction history.
- Client documents.
- Physical-redemption requests.
- Container-selection controls.
- Coil-selection controls.
- Logistics workflow.
- Customs and delivery documentation.
- Compliance review.
- DEX and exchange information.
- Mobile-application links.

18. Website Modes

- Development Mode.
- Pre-Launch Mode.
- Waitlist Mode.
- Documentation Release Mode.
- Asset Verification Mode.
- Eligibility Mode.
- Early Participation Mode.
- Live Offering Mode.
- Redemption Mode.
- Enterprise Onboarding Mode.

Activation Control

Live Offering, token purchase, wallet, payment, eligibility and redemption functions must require explicit authorized administrative and deployment actions. They must never activate automatically.

19. Technical Quality, SEO, Privacy and Monitoring

SEO

- Unique page titles.
- Meta descriptions.
- Canonical URLs.
- Open Graph metadata.
- Social-sharing images.
- Favicon and mobile icons.
- XML sitemap.
- Robots file.
- Structured data where appropriate.
- Redirect management.
- No-index controls for draft and inactive modules.
- Prevention of staging indexing.
- Search-engine accounts controlled by ReserveChain.

Privacy and Analytics

- Cookie-consent management.
- Separate essential, analytics and marketing controls.
- No non-essential tracking before consent.
- Withdrawal and modification of consent.
- Analytics accounts controlled by ReserveChain.
- No personal data in analytics, URLs or advertising events.
- Documentation of cookies, trackers and scripts.

Security

- HTTPS.
- HSTS.
- Content Security Policy.
- Secure response headers.
- XSS and CSRF protection.
- Input validation and output encoding.
- Secure cookies.
- Dependency and vulnerability review.
- File-type and size controls.
- Malware scanning where supported.
- Private-document access controls.

- Rate limiting.
- Safe error messages.
- Secure form processing.
- Spam and bot protection.

Accessibility and Performance

- Responsive images.
- WebP or AVIF.
- SVG brand assets.
- Lazy loading.
- Font optimization.
- Caching.
- Minimized production assets.
- Core Web Vitals review.
- Keyboard navigation.
- Visible focus states.
- Semantic HTML.
- Accessible forms and errors.
- Alternative text.
- Sufficient contrast.
- Reduced-motion support.
- Correct heading structure.

Monitoring

- Application errors.
- Contact-form delivery.
- Waitlist delivery.
- Email delivery.
- Uptime.
- Failed logins.
- Backup failures.
- Security events.
- Production deployments.

All monitoring accounts and alerts must be controlled by ReserveChain.

20. Environments, Backups, Ownership and Handover

Required Environments

- Development.
- Staging.
- Production.

Backup and Deployment Requirements

- Automated database backups.
- File and document backups.
- Encrypted backup storage.
- Retention periods.
- Restoration procedures.
- Periodic restoration testing.
- Protection from unauthorized deletion.
- Deployment procedures.
- Rollback procedures.
- Environment configuration.
- Production release approvals.

All repositories, hosting, domains, DNS, analytics, email systems, databases, storage, monitoring, third-party integrations and production services must be owned or controlled by ReserveChain.

Mandatory Technical Handover

- Complete source code.
- Repository ownership transfer.
- Database schema.
- Database migrations.
- API documentation.
- CMS documentation.
- Administrator manual.
- Website operations manual.
- Deployment manual.
- Backup and restoration manual.
- Environment-variable template without credentials.

- Infrastructure configuration.
- Domain and DNS configuration.
- Third-party service inventory.
- Dependency inventory.
- Build and release procedures.
- Update and rollback procedures.
- Security configuration.
- Testing report.
- Known-issues register.

Ownership Requirement

The platform must not remain dependent on accounts personally owned by the developer.

21. Content Handover Guide

Provide a ReserveChain Content Handover Guide defining:

- Required information for each asset program.
- Copper Powder data requirements.
- Nickel Wire data requirements.
- Required ownership documentation.
- Laboratory-report requirements.
- Certificate of Analysis requirements.
- Valuation requirements.
- Custody and warehouse requirements.
- Insurance-data requirements.
- Reserve-reporting requirements.
- Accepted file formats.
- Image and video standards.
- Minimum image resolution.
- Asset, lot, batch, container and coil naming conventions.
- Document naming conventions.
- Translation requirements.
- Upload procedures.
- Content-review workflow.
- Compliance-review workflow.
- Quality-control checklist.
- Publication-approval authorities.

22. Functional Acceptance Criteria

Acceptance Authority

All criteria must be verified by ReserveChain or an independently appointed reviewer. The developer's own statement of completion does not constitute final acceptance.

- ☐ No unsupported statistics remain.
- ☐ No unsupported reserve quantities remain.
- ☐ No active token-sale representation appears in pre-launch mode.
- ☐ No inactive purchase buttons remain visible.
- ☐ No fictional industrial asset is presented as verified.
- ☐ No unapproved laboratory, custody or insurance claim is displayed.
- ☐ All provisional information is clearly labelled.
- ☐ Copper Powder and Nickel Wire templates are complete.
- ☐ Lot, batch, container and coil data structures function correctly.
- ☐ The waitlist works end to end.
- ☐ Email verification and consent recording work.
- ☐ Enterprise and contact forms work.
- ☐ Administrative search, filtering and exports work.
- ☐ CMS functionality meets the approved scope.
- ☐ Publication controls work.
- ☐ Audit logs are append-only and tamper-evident.
- ☐ All required pages exist.
- ☐ Navigation works.

- ☐ Pre-launch, no-offer and risk notices are visible.
- ☐ Hidden modules are inaccessible and non-indexable.
- ☐ English, Spanish and Italian architecture is operational.
- ☐ Mobile, tablet and desktop layouts work.
- ☐ The official ReserveChain.io domain is configured.
- ☐ No template titles, fake figures, broken images, invalid routes or placeholder contact information remain.
- ☐ Development, staging and production environments are separated.
- ☐ Security, accessibility, performance and SEO tests are completed.
- ☐ Backup restoration is independently tested.
- ☐ Staging-to-production deployment and rollback are tested.
- ☐ Complete source code and documentation are transferred.
- ☐ All production accounts are controlled by ReserveChain.
- ☐ Known issues are documented.
- ☐ The work is available for independent verification.

FINAL BINDING STATEMENT

Binding Statement

This document constitutes the consolidated formal, technical and functional scope for the ReserveChain.io prelaunch website and complete technical ecosystem, including the token, backend, portals, mobile applications, whitepaper, deployment, documentation, training and handover. It supplements and does not reduce or replace the Final Master Development Instructions, project description, attachments, accepted proposal, milestone terms or subsequent written instructions. No requirement may be treated as completed until it has been implemented, tested, documented and made available for independent verification.

PART II

COMPLETE PHASE-BY-PHASE DELIVERY ROADMAP

Binding execution plan for the complete ReserveChain.io technical ecosystem

Governing Requirement

Every phase is mandatory unless the project owner expressly removes or defers it in writing. Features that cannot yet be activated because corporate, legal, asset, custody, insurance or regulatory inputs are pending must still be built, configurable, testable and kept inactive until authorized.

PHASES AT A GLANCE

Phase	Workstream	Status / Activation
1	Requirements, Architecture and Execution Blueprint	Immediate
2	UX/UI Design System and Public Website	Prelaunch active
3	Tokenomics Configuration and ERC-20 Smart Contract Suite	Build and test
4	Wallet, Treasury, Multisig and Key Management	Build and secure
5	Backend, Database, API and Blockchain Synchronization	Build and integrate
6	KYC, KYB, AML, Sanctions and Jurisdiction Integration	Prepare/integrate
7	Future Token Acquisition / USDT Module	Build but keep inactive
8	Investor Portal	Build; stage-based activation
9	Administrative, Operations and Compliance Portal	Build and test
10	Industrial Metals Registry and Digital Asset Passports	Build and test
11	Proof of Industrial Metal Reserves	Build; publish only approved data
12	Physical Industrial Metals Redemption	Build but keep inactive
13	iOS and Android Applications	Full mandatory delivery
14	Institutional Whitepaper and Investor Package	Two-stage delivery
15	DEX, Liquidity and Exchange Support	Conditional
16	Technical Marketing Infrastructure and Launch Support	Core infrastructure; campaigns conditional
17	Financial, Token and Operational Reconciliation	Mandatory
18	Secure Development, QA and Independent Audit	Mandatory
19	DevOps, Hosting, Monitoring and Business Continuity	Mandatory
20	Production Deployment, Authorized TGE and Launch	Written authorization required
21	Documentation, Source Code, Training and Handover	Mandatory acceptance gate
22	Warranty, Support and Exit Assistance	Mandatory

1. BINDING PROJECT PRINCIPLES

1. The phases below establish the order and control structure of development. They must not be interpreted as reducing the original Freelancer scope.
2. No required feature may be removed, postponed indefinitely, replaced with a mockup or reclassified as optional without our prior written approval.
3. Any legal, corporate, industrial metal, custody, valuation, insurance, jurisdictional or regulatory information that has not yet been provided must be marked: "Pending information or documentation to be provided or approved by the project owners or their appointed professional advisers."
4. Pending owner information does not authorize the developer to omit the relevant page, database field, workflow, administrative control, document area or system module.
5. The developer must build the relevant module using configurable fields and controlled placeholder or test data so it can be completed when the approved information is supplied.
6. Production publication of unverified statements, reserve values, ownership claims, legal conclusions, licenses, insurance claims or guaranteed redemption statements is prohibited.
7. Screenshots, static designs, mockups, incomplete demonstrations and verbal confirmations will not be accepted as completed functionality.
8. Every deliverable must be functional, testable, documented, deployed to the agreed environment and connected to the complete ecosystem.
9. All project accounts must be established under issuer-controlled organizational accounts wherever possible.

10. The developer must not retain permanent ownership, private keys, privileged roles, wallet control, liquidity control, repository control, domain control, hosting control, database control, application-store control or undocumented access.
11. Source code must be committed continuously to the issuer-controlled repository throughout development. Source-code delivery must not be postponed until the final day of the project.
12. No production deployment or token launch may occur without written issuer authorization.
13. No external expense may be incurred without prior written approval.
14. No exchange, app-store, regulatory, CoinMarketCap, CoinGecko, market-making or marketing outcome may be represented as guaranteed when it depends on a third party.
15. Any third-party library, theme, SDK, template, API, image, font, plugin or commercial component must be disclosed with its license, recurring cost, ownership limitations and replacement implications.

2. RESPONSIBILITY SEPARATION

A. DEVELOPER / AGENCY RESPONSIBILITIES

The selected developer or agency is responsible for:

- project management;
- requirements analysis;
- system architecture;
- UX/UI design;
- website development;
- smart contract development;
- token deployment;
- backend development;
- database development;
- API development;
- blockchain indexing and synchronization;
- investor portal development;
- admin portal development;
- future token-acquisition module development;
- KYC/AML provider integration;
- wallet integration;
- Proof of Reserves module development;
- industrial metals registry and asset-program management development;
- redemption portal development;
- iOS application development;
- Android application development;
- testing;
- security implementation;
- audit preparation;
- correction of audit findings within the agreed scope;
- deployment;
- DEX technical preparation;
- liquidity-pool technical setup support;
- exchange application preparation and support;
- CoinMarketCap and CoinGecko application support;
- institutional white paper drafting;
- investor deck preparation;
- tokenomics documentation;
- technical and risk-document drafting;
- technical marketing, SEO and campaign infrastructure; campaign execution only when separately authorized in writing;
- documentation;
- source-code handover;
- training;
- warranty;
- post-launch support.

The developer is not expected to personally act as legal counsel, independent smart contract auditor, industrial materials testing laboratory, independent appraiser, custodian, insurer, regulator, exchange, market maker or KYC provider.

However, the developer must coordinate and technically integrate the approved providers required by the project.

B. PROJECT OWNER RESPONSIBILITIES

The project owners or their appointed professionals will provide or approve, as applicable:

- legal entity information;
- official company documents;
- authorized signatories;

- project name, token name and token symbol;
- approved token economic decisions;
- legal and regulatory opinions;
- approved jurisdictions;
- restricted jurisdictions;
- investor eligibility rules;
- privacy and retention instructions;
- industrial metal ownership, title and acquisition documents;
- laboratory certificates, assay reports and purity reports;
- inventory information;
- valuation reports;
- custody agreements;
- insurance documents;
- reserve disclosures;
- redemption commercial and legal rules;
- verified corporate biographies;
- official contact information;
- final legal disclaimers;
- liquidity funds;
- third-party provider budgets;
- exchange fees;
- audit fees;
- app-store fees;
- paid advertising budgets;
- influencer and PR budgets;
- final publication and launch approvals.

C. THIRD-PARTY RESPONSIBILITIES

Independent providers may be required for:

- legal advice;
- regulatory advice;
- KYC/KYB verification;
- sanctions screening;
- blockchain analytics;
- smart contract auditing;
- penetration testing;
- industrial metal testing, assay and certification;
- independent valuation;
- custody;
- insurance;
- electronic signatures;
- hosting or cloud infrastructure;
- transactional email or SMS;
- market making;
- exchange review;
- application-store review;
- public relations;
- paid advertising;
- influencer campaigns.

The developer must identify, integrate and coordinate the approved providers but must not misrepresent third-party decisions as being under the developer's control.

3. RESERVECHAIN COMMERCIAL MODEL IMPLEMENTATION REQUIREMENTS

The developer must implement the commercial operating model described in the ReserveChain Institutional Investment Memorandum. The platform must not be limited to token issuance; it must provide configurable, auditable commercial infrastructure for asset acquisition, structuring, tokenization, administration, trading support, physical redemption, enterprise services and technology licensing.

Mandatory commercial capabilities

- separate asset programs for Copper Powder, Nickel Wire and future approved real-world assets;
- configurable ERC-20 token or token-series architecture for each approved asset program, subject to final issuer instructions;
- recording of acquisition or structuring cost, independent assessed value, approved investor introduction value and the resulting commercial spread;
- configurable Early Participation Program pricing and discounts by asset program;

- tokenization and structuring fee configuration;
- recurring platform administration, verification, reporting, custody-allocation and insurance-allocation fee configuration;
- physical redemption processing, logistics and administrative fee configuration;
- enterprise tokenization and asset-origination service fees;
- technology licensing, white-label and enterprise platform fee configuration;
- separate treasury, revenue, fee, liquidity and operational wallet or account reporting;
- program-level profit-and-loss, cash-flow, revenue, cost, reserve and investor reporting;
- complete audit trail for every commercial-rate, discount, fee and valuation change;
- maker-checker approval for material commercial configuration changes;
- no hard-coded percentage, price, spread, fee or discount that cannot be changed by an authorized issuer administrator;
- clear segregation between investor asset-program funds and platform development or operating capital, according to the final approved legal and accounting structure;
- commercial dashboards for management, finance, operations, compliance and institutional reporting.

Final commercial percentages, pricing formulas, fee schedules, accounting treatment and investor terms will be supplied or approved by the project owners. The developer is responsible for implementing the configurable technical and reporting infrastructure, not for independently determining the legal or accounting treatment.

PHASE 1 - REQUIREMENTS, ARCHITECTURE AND EXECUTION BLUEPRINT

Before major development continues, prepare the definitive technical and operational blueprint.

Deliverables

- complete requirements document;
- requirements traceability matrix mapping every Freelancer requirement to a development phase and deliverable;
- complete system architecture;
- smart contract architecture;
- website architecture;
- investor portal architecture;
- admin portal architecture;
- token-acquisition module architecture;
- KYC/AML integration architecture;
- industrial metals registry and asset-program management architecture;
- multi-asset token factory and asset-program lifecycle architecture;
- asset-owner, originator and enterprise-client portal architecture;
- Proof of Reserves architecture;
- redemption architecture;
- iOS architecture;
- Android architecture;
- backend and API architecture;
- database architecture;
- blockchain indexing architecture;
- wallet and treasury architecture;
- infrastructure and deployment architecture;
- notification architecture;
- reporting architecture;
- security architecture;
- data-flow diagrams;
- user-role and permission matrix;
- administrator-role matrix;
- third-party integration matrix;
- development, staging and production environment plan;
- technology stack;
- project schedule;
- critical-path dependencies;
- project risk register;
- third-party cost register;
- owner-input register;
- launch dependency register;
- app-store submission strategy;
- exchange and listing roadmap;
- marketing execution roadmap;
- documentation plan;
- testing plan;
- handover plan.

Required project governance

- named project manager;
- named blockchain lead;
- named backend lead;
- named frontend lead;
- named iOS/Android lead or leads;
- named DevOps/security lead;
- named QA lead;
- named documentation lead;
- named exchange/listing lead;
- named marketing lead;
- weekly progress meeting;
- weekly written status report;
- issue tracker;
- change-request register;
- risk and dependency register;
- milestone acceptance register;
- single issuer-controlled source repository;

- formal version and release management.

Acceptance criteria

- every original Freelancer requirement is mapped;
- no scope item remains unassigned;
- architecture is internally consistent;
- dependencies and owner inputs are clearly separated;
- technology stack is approved;
- milestone schedule is approved;
- no development-critical ambiguity remains undisclosed.

PHASE 2 - UX/UI DESIGN SYSTEM AND PUBLIC WEBSITE

Complete the professional public-facing website and its content-management capability.

Deliverables

- institutional visual design system;
- responsive desktop, tablet and mobile interfaces;
- home page;
- project overview;
- Swiss corporate and issuer status section (under formation);
- industrial-metals-backed RWA model section;
- token structure;
- tokenomics;
- future token-acquisition information;
- Proof of Reserves explanation;
- industrial metal reserve section;
- Copper Powder (99.9999%) asset-program page;
- Nickel Wire (99.9807%) asset-program page;
- enterprise tokenization services page;
- asset-owner/originator onboarding page;
- commercial model and revenue-stream explanation, using approved disclosures;
- custody and insurance section;
- redemption explanation;
- roadmap;
- governance section;
- team section;
- white paper and investor-document library;
- risk-disclosure section;
- FAQ;
- contact forms;
- investor lead-capture forms;
- news and announcement section;
- official social-media directory;
- official smart contract address section;
- anti-fraud and anti-impersonation notice;
- privacy policy;
- cookie policy;
- website terms;
- risk disclaimer;
- jurisdiction restriction notice;
- accessibility implementation;
- search-engine optimization;
- analytics and conversion tracking;
- cookie and consent management;
- multilingual-ready architecture;
- content-management system;
- administrative content editing;
- document versioning;
- publication approval controls;
- historical-document archive;
- secure contact-form processing;
- spam and bot protection;
- performance optimization;
- backup capability;
- website operations manual.

Owner-supplied or owner-approved information

- verified issuer details;
- verified industrial metal information;
- verified reserve figures;
- custody information;
- insurance information;
- legal text;
- regulatory statements;
- official team information.

The developer must create and configure the sections even when final approved content remains pending.

PHASE 3 - TOKENOMICS CONFIGURATION AND ERC-20 SMART CONTRACT SUITE

The primary token must be an ERC-20 token deployed on Ethereum Mainnet.

Binance Smart Chain or BEP-20 will not be accepted as the primary chain. Any secondary chain or bridge requires separate written approval.

Deliverables

- final technical token specification;
- written decision and implementation plan for single-token versus separate token-series architecture;
- support for separate asset-program identifiers, reserve linkages and supply reconciliations;
- ability to deploy additional issuer-approved asset-program contracts without rebuilding the entire platform;
- token name, symbol and decimals configuration;
- fixed or capped supply;
- supply-allocation configuration;
- treasury allocation;
- token-acquisition module allocation;
- liquidity allocation;
- vesting or lockup functionality where approved;
- unsold-token treatment;
- burn functionality;
- redemption-related burn functionality;
- ERC-20 Solidity contract;
- OpenZeppelin or equivalent audited-library implementation;
- role-based access controls;
- issuer-controlled multisig administration;
- transparent privileged-role matrix;
- emergency pause only if expressly approved and disclosed;
- treasury contract where required;
- token-acquisition module contract where required;
- vesting contract where required;
- testnet deployment;
- deployment scripts;
- ABI files;
- compiler settings;
- source-code documentation;
- unit testing;
- integration testing;
- event testing;
- supply testing;
- access-control testing;
- fuzz or invariant testing where appropriate;
- gas-usage report;
- test-coverage report;
- audit-ready repository;
- independent audit coordination;
- audit-finding correction;
- audit re-test support;
- Ethereum Mainnet deployment after approval;
- Etherscan verification;
- ownership and role transfer to issuer-controlled wallets;
- final contract-address register.

Prohibited functionality

- hidden transaction taxes;
- undisclosed fees;
- honeypot functions;
- covert blacklists;
- hidden minting;
- hidden sell restrictions;
- hidden transfer restrictions;
- developer-controlled backdoors;
- unrestricted owner seizure;
- undocumented privileged roles;
- undisclosed proxy upgrades;
- developer-retained ownership;
- developer-retained administrative access.

Any upgradeability must be expressly approved, documented and governed by issuer-controlled multisig and, where approved, a timelock.

PHASE 4 - WALLET, TREASURY, MULTISIG AND KEY-MANAGEMENT IMPLEMENTATION

Deliverables

- issuer-controlled deployer wallet;
- issuer-controlled treasury multisig;
- issuer-controlled token-acquisition module-receipt wallet;
- issuer-controlled liquidity wallet or multisig;
- issuer-controlled operational wallet;
- segregation of treasury, liquidity, token-acquisition module and operational funds;
- signer and approval-threshold configuration;
- wallet-role register;
- contract-role register;
- hardware-wallet compatibility;
- secure key-generation procedure;
- signer replacement procedure;
- compromised-key procedure;
- signer-removal procedure;
- wallet recovery plan;
- privileged-transaction approval workflow;
- transaction monitoring;
- privileged-action alerts;
- test transactions;
- final issuer-control verification;
- wallet and key-management manual;
- recorded operational training without exposing private keys.

No seed phrase or private key may be stored in source code, ordinary cloud storage, email, project chat or documentation.

The developer must not retain a seed phrase, private key or required signer role after handover.

PHASE 5 - BACKEND, DATABASE, API AND BLOCKCHAIN SYNCHRONIZATION

Deliverables

- production-grade backend;
- documented API layer;
- secure authentication;
- two-factor authentication;
- role-based authorization;
- secure session management;
- device and session controls;
- database schema;
- database migrations;
- transaction ledger;
- audit log;
- immutable history for sensitive actions;
- document-storage architecture;
- document versioning;
- blockchain event indexer;
- transaction confirmation tracking;
- blockchain reorganization handling;
- webhook authentication;
- idempotent transaction processing;
- duplicate-event prevention;
- failed-event retry handling;
- token-supply synchronization;
- wallet-balance synchronization;
- token-acquisition module synchronization;
- redemption synchronization;
- reporting engine;
- PDF and CSV exports;
- notification service;
- transactional email system;
- administrative search and filtering;
- rate limiting;
- input validation;
- error logging;
- application monitoring;
- API documentation;
- integration tests;
- backend technical manual.

Financial or token balances must not be maintained solely as manually editable database fields. Every balance-affecting action must have a supporting transaction, reason, timestamp, user, wallet or reference and audit history.

PHASE 6 - KYC, KYB, AML, SANCTIONS AND JURISDICTION INTEGRATION

The developer must recommend suitable providers, disclose their costs and integrate the provider selected by the project owners.

Deliverables

- individual KYC workflow;
- corporate KYB workflow;
- identity-document verification;
- liveness verification where supported;
- beneficial-owner collection;
- corporate-document collection;
- PEP screening;
- sanctions screening;
- source-of-funds declaration;
- source-of-wealth workflow where required;
- risk-status field;
- enhanced review workflow;
- manual review workflow;
- approval workflow;
- rejection workflow;
- resubmission workflow;
- periodic review capability;
- jurisdiction controls;
- country blocking;
- wallet ownership verification;
- wallet-risk screening where selected;
- compliance-status synchronization;
- provider-webhook integration;
- compliance case notes;
- compliance document storage;
- decision audit trail;
- terms acceptance;
- privacy acceptance;
- risk acknowledgement;
- subscription-document acceptance;
- version, timestamp, IP, account and wallet logging;
- compliance dashboard;
- compliance reports;
- data-retention configuration;
- KYC/KYB integration manual.

The project owners or appointed advisers will determine the final legal rules, restricted jurisdictions and approval policies.

The developer must implement those rules but is not responsible for issuing a legal or regulatory opinion.

PHASE 7 - FUTURE TOKEN ACQUISITION / USDT ERC-20 MODULE (BUILD BUT KEEP INACTIVE)

Mandatory Inactive Status

This module must be developed and tested with test data, but it must remain disabled, hidden and incapable of accepting funds until final legal documentation, eligibility controls, contracts, treasury controls, reconciliation and written launch authorization are complete.

Deliverables

- investor registration;
- wallet connection;
- cryptographic wallet-signature authentication;
- Ethereum network validation;
- wrong-network protection;
- official USDT ERC-20 contract validation;
- KYC approval gating;
- sanctions and jurisdiction gating;
- terms and risk acceptance;
- USDT allowance and approval workflow;
- USDT payment workflow;
- token purchase calculator;
- token decimal handling;
- USDT decimal handling;
- exchange-rate or approved participation-price configuration;
- participation-round configuration;
- discount configuration;
- start and end dates;
- minimum purchase;
- maximum purchase;
- investor limits;
- total token-acquisition module cap;
- oversubscription handling;
- underpayment handling;
- overpayment handling;
- failed transaction handling;
- duplicate payment prevention;
- blockchain confirmation rules;
- purchase receipt;
- subscription confirmation;
- token allocation record;
- pending, approved, rejected, distributed and refunded statuses;
- token distribution workflow;
- vesting or lockup display where applicable;
- investor purchase history;
- admin approval controls;
- wallet-by-wallet reporting;
- jurisdiction reporting;
- KYC-status reporting;
- USDT reconciliation;
- token-allocation reconciliation;
- treasury reconciliation;
- fraud alerts;
- testnet token-acquisition workflow;
- end-to-end token-acquisition testing;
- token-acquisition module operations manual;
- participant token-acquisition user guide.

No live funds may be accepted until the system, contracts, wallet controls, KYC gating and reconciliation have passed testing and received written approval.

PHASE 8 - INVESTOR PORTAL

Deliverables

- investor registration;
- email verification;
- secure login;
- two-factor authentication;
- investor profile;
- corporate profile where applicable;
- KYC/KYB progress;
- compliance status;
- wallet connection;
- verified-wallet management;
- token balance;
- purchase calculator;
- USDT purchase flow;
- purchase history;
- token allocation history;
- vesting or lockup information;
- transaction status;
- investor dashboard;
- industrial metal reserve summary;
- Proof of Reserves access;
- private data-room access according to permission;
- investor document library;
- signed-document archive;
- notices and announcements;
- redemption request;
- redemption history;
- notifications;
- support tickets;
- secure account settings;
- session management;
- data-export request;
- account-closure request;
- investor portal manual.

PHASE 9 - ADMINISTRATIVE, OPERATIONS AND COMPLIANCE PORTAL

Deliverables

- secure admin login;
- two-factor authentication;
- role-based permissions;
- separate super-admin, operations, compliance, finance, treasury, support, content and audit roles;
- maker-checker or dual-approval controls for sensitive actions;
- investor management;
- enterprise asset-owner and originator onboarding;
- new asset-program application and due-diligence workflow;
- asset acceptance, rejection, pending-review and remediation statuses;
- commercial fee, spread, introduction-value and program-parameter configuration;
- separate operational views and permissions for each asset program;
- KYC/KYB management;
- wallet management;
- jurisdiction controls;
- token-acquisition module management;
- payment confirmation;
- token-allocation management;
- token-distribution controls;
- industrial metals registry and asset-program management;
- Proof of Reserves management;
- custody-document management;
- insurance-document management;
- valuation-document management;
- redemption management;
- content management;
- legal-document version management;
- notifications;
- support management;
- administrative notes;
- audit logs;
- privileged-action alerts;
- financial reports;
- token reports;
- token-acquisition module reports;
- reserve reports;
- redemption reports;
- compliance reports;
- marketing reports;
- CSV and PDF exports;
- configurable platform settings;
- admin portal manual;
- recorded admin training.

The system must allow the project owners and their authorized team to operate the platform without depending on the original developer for normal administrative work.

PHASE 10 - INDUSTRIAL METALS REGISTRY, ASSET PROGRAM MANAGEMENT AND DIGITAL ASSET PASSPORT

Deliverables

- unique asset-program identifier;
- unique lot, batch, container, coil or packaged-unit identifier;
- asset class and industrial metal type;
- physical form, including powder, wire, coil, container, package or other approved form;
- asset description and commercial grade;
- quantity and unit of measure;
- gross weight and net weight;
- declared and independently tested purity;
- chemical composition and impurity profile where documented;
- dimensions, gauge, diameter or particle specification where applicable;
- packaging, seal and container information;
- manufacturer, producer, seller or source information where approved;
- country of origin and current location where documented;
- laboratory, inspection or assay provider;
- laboratory report, certificate or assay number;
- test, inspection and certificate dates;
- laboratory report, certificate and supporting-document uploads;
- photographs, labels, seals and inspection-image records;
- ownership, title and acquisition-document uploads;
- purchase, assignment or contribution documentation;
- independent valuation or assessed market value;
- valuation currency, date and methodology;
- valuer identity and supporting valuation documents;
- acquisition or structuring cost where authorized;
- approved investor introduction value where authorized;
- commercial spread and fee fields with restricted permissions;
- custody location, vault, warehouse or storage-zone reference;
- custody agreement and inventory-report uploads;
- insurance information and supporting-document uploads;
- reserve eligibility and asset-acceptance status;
- encumbrance, lien and restriction status fields;
- asset-document hashes or evidence references where implemented;
- chain-of-custody, movement and transfer history;
- inspection, testing and re-verification history;
- revaluation and impairment history;
- token-program, supply and reserve-allocation linkage;
- physical redemption unit and redemption status;
- archive, withdrawal, suspension or retirement status;
- complete change and approval history;
- public, investor, auditor, custodian and administrator data permissions;
- administrative bulk import, export and reconciliation;
- industrial metals registry and asset-program management manual.

All substantive industrial metal data and documents will be supplied or approved by the project owners or appointed professionals.

The developer is responsible for building a secure and auditable system to manage the information, not for independently certifying its legal or commercial validity.

PHASE 11 - PROOF OF INDUSTRIAL METAL RESERVES PLATFORM

Deliverables

- public reserve dashboard;
- private institutional data room;
- issued token supply;
- circulating supply;
- treasury-held supply;
- locked supply;
- burned supply;
- redeemed supply;
- approved reserve value;
- reserve coverage calculation;
- reserve coverage ratio;
- valuation date;
- attestation date;
- custody summary;
- insurance summary;
- metal lot, batch, container or coil summaries;
- reserve breakdown by asset program, metal type, lot, batch, container and coil;
- program-specific token supply, reserve value and coverage ratio;
- independent assay, inspection and quantity-verification summaries;
- custodian inventory reconciliation by identifiable physical unit;
- supporting document access;
- reserve-report uploads;
- independent-attestation uploads;
- historical reserve reports;
- reserve-update history;
- supply reconciliation;
- burn reconciliation;
- redemption reconciliation;
- reserve-change audit trail;
- stale-valuation alerts;
- expiring-document alerts;
- missing-document alerts;
- reserve exception report;
- public/private information controls;
- Proof of Reserves API or export where approved;
- publication approval workflow;
- Proof of Reserves manual.

The platform must not automatically describe uploaded information as independently verified unless an approved independent verification or attestation has actually been provided.

PHASE 12 - PHYSICAL INDUSTRIAL METALS REDEMPTION PORTAL

Deliverables

- wallet connection;
- wallet ownership verification;
- token balance verification;
- redemption eligibility check;
- KYC/AML and sanctions re-check;
- jurisdiction check;
- minimum redemption threshold;
- redemption calculator;
- metal lot, batch, container or coil selection logic where applicable;
- container-by-container redemption rules for Copper Powder where approved;
- coil-by-coil redemption rules for Nickel Wire where approved;
- minimum physical unit, weight and packaging constraints;
- industrial handling, loading, transport and dangerous-goods assessment where applicable;
- customs, export, import and delivery-document fields;
- substitution rules where approved;
- redemption-fee configuration;
- tax field;
- shipping field;
- insurance field;
- custody charge field;
- packaging and delivery charge field;
- complete cost calculation;
- redemption terms acceptance;
- electronic signature integration or workflow;
- supporting-document upload;
- redemption submission;
- administrative review;
- approval or rejection;
- maker-checker authorization;
- token lock before final completion where approved;
- token burn;
- burn transaction record;
- custodian release instruction;
- delivery, collection or shipment workflow;
- status tracking;
- failed-delivery handling;
- cancellation rules;
- dispute workflow;
- redemption confirmation;
- title-transfer document area;
- redemption history;
- industrial metals registry and asset-program management update;
- reserve update;
- Proof of Reserves update;
- token-supply reconciliation;
- accounting reconciliation;
- complete audit history;
- redemption operations manual;
- investor redemption guide.

The legal redemption rights, minimum amounts, delivery conditions, fees, taxes and custody rules will be supplied or approved by the project owners.

The developer must make the relevant rules configurable rather than hard-coding unapproved assumptions.

PHASE 13 - iOS AND ANDROID APPLICATIONS

Mobile Delivery Is Mandatory

The iOS and Android applications are full project deliverables, not optional extensions. A responsive website, web wrapper, source-code archive, APK or IPA alone does not satisfy delivery. The applications must be functional, integrated, tested, documented and deployed through TestFlight and Google Play testing under ReserveChain-controlled accounts.

The applications must be functional components of the same ecosystem, not static informational applications or simple website wrappers unless expressly approved.

Deliverables

- iOS application;
- Android application;
- secure authentication;
- two-factor authentication;
- investor profile;
- KYC/KYB status;
- wallet connection;
- wallet-signature authentication;
- token balance;
- USDT purchase flow;
- purchase history;
- allocation history;
- Proof of Reserves;
- industrial metal reserve summaries;
- investor document library;
- redemption request;
- redemption tracking;
- push notifications;
- security alerts;
- announcements;
- support system;
- backend/API integration;
- secure local storage;
- secure network communication;
- deep-link protection;
- session management;
- biometric access where approved;
- crash reporting;
- application analytics;
- privacy disclosures;
- financial-feature declarations;
- iOS TestFlight distribution;
- Android internal or closed testing distribution;
- App Store submission support;
- Google Play submission support;
- correction of technical or policy implementation issues attributable to the delivered application;
- resubmission support within the agreed support period;
- APK delivery;
- AAB delivery;
- iOS build archive where applicable;
- complete source code;
- build instructions;
- signing instructions;
- store-listing assets;
- store descriptions and screenshots;
- privacy-form support;
- app user manual;
- iOS development manual;
- Android development manual.

Mandatory Mobile Application Acceptance Gate

- Both applications must use the same production backend, authentication, permissions, compliance status and data sources as the web ecosystem.
- A simple WebView, static information app or unintegrated prototype is not acceptable unless expressly approved in writing.
- The developer must provide TestFlight and Google Play internal or closed-testing access before phase acceptance.

- The developer must prepare and submit the applications through ReserveChain-controlled Apple Developer and Google Play organization accounts.
- The developer must correct technical, privacy, metadata and policy-implementation issues attributable to the delivered applications and support resubmission during the agreed support period.
- Signing certificates, provisioning profiles, Android upload keys, keystore procedures, package identifiers, bundle identifiers, Firebase projects, push-notification credentials and store configurations must be transferred and documented.
- ReserveChain or a replacement developer must be able to build, sign, submit and update both applications using the delivered source code and manuals.

The Apple Developer and Google Play organization accounts must be controlled by the project owners.

Store approval is a third-party decision and cannot be guaranteed. However, the developer remains responsible for properly preparing the applications, submissions and technical corrections within the agreed scope.

PHASE 14 - INSTITUTIONAL WHITE PAPER AND INVESTOR PACKAGE

The Freelancer scope requires the selected team to prepare an institutional-quality investor package.

Developer deliverables

- institutional white paper;
- investor presentation;
- tokenomics document;
- technical architecture summary;
- Ethereum/ERC-20 explanation;
- future USDT token-acquisition module explanation;
- industrial-metals-backed RWA model;
- reserve methodology;
- Proof of Reserves explanation;
- custody and insurance summary;
- redemption process;
- TGE plan;
- DEX strategy;
- CEX strategy;
- liquidity strategy;
- roadmap;
- use of funds;
- risk disclosures;
- conflicts disclosures where supplied;
- jurisdiction restriction section;
- project disclaimers;
- investor FAQ;
- professionally formatted PDF and editable source versions;
- website and portal integration;
- document versioning;
- document approval history;
- consistency review across website, apps, portal and marketing materials.

Owner inputs

- verified corporate facts;
- verified industrial metal information;
- approved valuations;
- custody and insurance information;
- approved legal conclusions;
- risk and jurisdiction instructions;
- final approval.

Mandatory Two-Stage Whitepaper Delivery

- Stage 1: prepare a complete institutional draft using approved project information and clearly marked proposed/pending sections.
- Stage 2: incorporate the final Swiss company, legal, asset, laboratory, valuation, custody, insurance, tokenomics, jurisdiction and offering information supplied or approved by the project owner and appointed advisers.
- Deliver editable DOCX, publication-ready PDF, all source diagrams/graphics, version history, approval record and instructions for future updates.
- The developer must perform a consistency review across the website, portals, apps, whitepaper, tokenomics and public documents before publication.

The developer must prepare the documents based on approved information. The developer must not invent legal conclusions, ownership claims, valuations, guarantees or regulatory approvals.

PHASE 15 - DEX, LIQUIDITY, MARKET-DATA AND EXCHANGE SUPPORT (CONDITIONAL)

Conditional Launch Phase

No liquidity pool, trading pair, exchange application, token metadata publication or market-data submission may occur without written authorization. Third-party listing or approval outcomes cannot be guaranteed.

Deliverables

- TGE technical plan;
- Uniswap deployment strategy;
- TOKEN/USDT analysis;
- TOKEN/USDC analysis;
- recommended trading-pair strategy;
- liquidity-pool technical setup;
- initial-liquidity recommendation;
- slippage analysis;
- initial-price configuration;
- liquidity-custody recommendation;
- multisig liquidity control;
- liquidity-lock assessment;
- liquidity-provider due diligence;
- DEXTools preparation;
- DexScreener preparation;
- official token information package;
- CoinMarketCap application preparation and submission support;
- CoinGecko application preparation and submission support;
- token-supply information;
- contract information;
- logos and metadata;
- CEX due-diligence data room;
- exchange technical questionnaire;
- exchange security questionnaire;
- target CEX strategy;
- target-exchange prioritization;
- estimated listing fees;
- estimated integration costs;
- market-maker recommendations;
- market-maker due diligence support;
- prohibition of wash trading and artificial volume;
- listing application tracker;
- response to exchange information requests;
- 30-day roadmap;
- 60-day roadmap;
- 90-day roadmap;
- 120-day roadmap;
- exchange/listing manual;
- complete handover of application records and contacts.

The developer may not claim guaranteed listing on Binance, Coinbase, Kraken, OKX, Bybit, KuCoin, Gate.io, MEXC or any other exchange without verifiable direct contractual capacity.

Listing fees, liquidity, market-maker fees and exchange decisions are external matters unless expressly included in writing.

PHASE 16 - TECHNICAL MARKETING INFRASTRUCTURE, SEO AND LAUNCH SUPPORT

Scope Boundary

The developer must deliver the website SEO, analytics, campaign landing pages, lead-capture, CRM integration capability, editable marketing assets and launch-support infrastructure. Paid advertising, PR, influencer activity, community management or ongoing investor-acquisition campaigns are included only when separately authorized and budgeted in writing.

This phase includes actual agreed marketing work, not only the creation of marketing tools.

Deliverables

- brand positioning;
- target-market segmentation;
- RWA investor strategy;
- cryptocurrency buyer strategy;
- industrial commodity buyer, manufacturer and metals-trader strategy;
- industrial manufacturers and strategic off-taker strategy;
- commodity trading house and metals broker strategy;
- supply-chain finance and inventory monetization strategy;
- asset-owner and enterprise tokenization client acquisition strategy;
- industrial procurement, technology-materials and specialty-metals audience strategy;
- family-office strategy;
- institutional investor strategy;
- OTC and broker strategy;
- geographic targeting strategy;
- jurisdiction-specific campaign controls;
- website landing pages;
- investor funnel;
- lead-capture forms;
- CRM configuration or integration;
- email campaign sequences;
- Telegram setup and management plan;
- X/Twitter strategy;
- LinkedIn strategy;
- YouTube strategy;
- content calendar;
- educational content;
- PR strategy;
- media-target list;
- link-building plan;
- SEO content;
- influencer strategy;
- influencer due diligence;
- advertising plan;
- AMA plan;
- webinar plan;
- broker outreach;
- OTC outreach;
- community launch;
- campaign analytics;
- conversion tracking;
- KPI dashboard;
- weekly performance reports;
- monthly performance reports;
- evidence of completed activity;
- marketing materials and editable source files;
- marketing-content handover manual.

Prohibited

- fake followers;
- fake volume;
- fake liquidity;
- bots;
- artificial engagement;
- fabricated partnerships;
- fabricated media coverage;

- misleading reserve claims;
- guaranteed-profit claims;
- guaranteed-price claims;
- guaranteed-listing claims;
- undisclosed paid promotion.

PHASE 17 - FINANCIAL, TOKEN AND OPERATIONAL RECONCILIATION

Deliverables

- USDT receipt ledger;
- token allocation ledger;
- token distribution ledger;
- treasury ledger;
- liquidity ledger;
- fee ledger;
- redemption ledger;
- burn ledger;
- reserve ledger;
- asset-program acquisition and structuring-cost ledger;
- approved valuation and investor introduction-value ledger;
- asset acquisition spread ledger;
- tokenization and structuring fee ledger;
- recurring administration and reporting fee ledger;
- enterprise tokenization services revenue ledger;
- technology licensing and white-label revenue ledger;
- program-level cost allocation and profitability reporting;
- daily reconciliation;
- blockchain-to-database reconciliation;
- wallet-to-ledger reconciliation;
- token-acquisition module-to-treasury reconciliation;
- token-supply reconciliation;
- token-allocation reconciliation;
- reserve-coverage reconciliation;
- redemption reconciliation;
- exception reports;
- transaction-reference records;
- exchange-rate records where used;
- accounting exports;
- management reports;
- CSV/PDF reports;
- administrator reconciliation tools;
- complete reconciliation manual.

The system must detect and report inconsistencies rather than silently adjusting balances.

PHASE 18 - SECURE DEVELOPMENT, QA AND INDEPENDENT AUDIT

Deliverables

- secure software development lifecycle;
- coding standards;
- peer code review;
- protected repository branches;
- pull-request approvals;
- automated builds;
- automated testing;
- dependency inventory;
- software bill of materials;
- dependency vulnerability scanning;
- secret scanning;
- static application security testing;
- dynamic application security testing;
- mobile application security testing;
- container or infrastructure scanning where applicable;
- third-party license inventory;
- source-code test coverage;
- complete QA plan;
- requirements traceability testing;
- website testing;
- investor portal testing;
- admin portal testing;
- KYC workflow testing;
- sanctions workflow testing;
- token-acquisition module testing;
- wallet testing;
- USDT decimal and rounding testing;
- duplicate-payment testing;
- failed-transaction testing;
- Proof of Reserves testing;
- redemption testing;
- token-lock and burn testing;
- reserve-update testing;
- iOS testing;
- Android testing;
- browser testing;
- device testing;
- API testing;
- performance testing;
- load testing;
- backup-restoration testing;
- role and permission testing;
- user acceptance testing;
- defect register;
- severity classification;
- correction evidence;
- regression testing;
- independent smart contract audit;
- audit remediation;
- auditor re-test support;
- backend/API penetration test;
- mobile security assessment;
- final QA report;
- final security report.

No production launch may occur with:

- unresolved critical defects;
- unresolved critical smart contract findings;
- unresolved high-risk findings without written risk acceptance;
- failed token-supply reconciliation;
- failed token-acquisition module reconciliation;
- failed redemption test;
- failed backup-restoration test;

- incomplete issuer-control transfer.

PHASE 19 - DEVOPS, HOSTING, MONITORING AND BUSINESS CONTINUITY

Deliverables

- issuer-controlled cloud or hosting account;
- development environment;
- staging environment;
- production environment;
- continuous integration and deployment process;
- infrastructure documentation;
- infrastructure as code where applicable;
- secure environment variables;
- secret-management system;
- database deployment;
- encrypted data transmission;
- encrypted sensitive storage;
- network access controls;
- web application firewall;
- DDoS protection;
- rate limiting;
- centralized logging;
- application monitoring;
- blockchain monitoring;
- wallet monitoring;
- uptime monitoring;
- error tracking;
- alerting;
- incident escalation;
- automated backups;
- off-site backup;
- backup retention;
- restoration testing;
- rollback procedure;
- disaster-recovery procedure;
- recovery objectives;
- domain configuration;
- DNS configuration;
- SSL configuration;
- domain-lock protection;
- transactional email configuration;
- SPF, DKIM and DMARC configuration where applicable;
- certificate-renewal procedure;
- patch-management procedure;
- status-page capability where approved;
- incident-response runbook;
- DevOps manual;
- backup and recovery manual.

The developer must not retain the ability to delete, disable or control the production environment after final handover.

PHASE 20 - PRODUCTION DEPLOYMENT, AUTHORIZED TGE AND CONTROLLED LAUNCH

Written Launch Gate

Production token issuance, live payments, TGE, public trading, active wallet functionality and redemption may occur only after the project owner issues written authorization following legal, asset, custody, security, operational and acceptance approvals.

Deliverables

- production-readiness review;
- approved release candidate;
- final smart contract build verification;
- mainnet deployment;
- Etherscan verification;
- issuer multisig control confirmation;
- privileged-role confirmation;
- website production deployment;
- investor portal deployment;
- admin portal deployment;
- token-acquisition module deployment;
- Proof of Reserves deployment;
- redemption portal deployment;
- iOS release support;
- Android release support;
- official contract-address publication;
- anti-scam announcement;
- token distribution plan;
- TGE execution;
- liquidity-pool setup after authorization;
- launch monitoring;
- launch support;
- launch-day reconciliation;
- incident-response activation;
- 24-hour review;
- 72-hour review;
- seven-day review;
- 30-day review;
- production acceptance report.

No production launch, TGE, token-acquisition module activation, token distribution or liquidity-pool creation may occur without written project-owner approval.

PHASE 21 - COMPLETE DOCUMENTATION, SOURCE CODE, TRAINING AND HANDOVER

Independent Operation Standard

Handover is not complete until ReserveChain or a replacement technical team can build, deploy, operate, update, back up, restore and troubleshoot the complete ecosystem from the delivered source code and project-specific manuals without dependence on the original developer.

The project will not be considered complete without this phase.

Mandatory deliverables

- complete source code;
- complete Git history;
- issuer-controlled repository;
- smart contract source code;
- website source code;
- frontend source code;
- backend source code;
- API source code;
- investor portal source code;
- admin portal source code;
- token-acquisition module source code;
- Proof of Reserves source code;
- industrial metals registry and asset-program management source code;
- asset-owner and enterprise-originator portal source code;
- multi-asset token-program configuration source code;
- redemption portal source code;
- iOS source code;
- Android source code;
- database schema;
- database migrations;
- deployment scripts;
- infrastructure scripts;
- automated test suites;
- build pipelines;
- application build files;
- contract ABI files;
- system architecture manual;
- smart contract technical manual;
- smart contract operations manual;
- token deployment manual;
- wallet and key-management manual;
- token-acquisition module operations manual;
- website administration manual;
- investor portal manual;
- admin portal manual;
- KYC/AML integration manual;
- industrial metals registry and asset-program management manual;
- asset-owner and enterprise-originator portal manual;
- multi-asset program creation, configuration and lifecycle manual;
- commercial fee, spread, value and revenue-configuration manual;
- Proof of Reserves manual;
- redemption manual;
- accounting and reconciliation manual;
- iOS development and deployment manual;
- Android development and deployment manual;
- backend and API documentation;
- database documentation;
- DevOps and deployment manual;
- backup and restore manual;
- security manual;
- incident-response manual;
- exchange and listing manual;
- marketing handover manual;
- content-management manual;
- support manual;
- third-party vendor register;

- dependency and license register;
- software bill of materials;
- environment-variable inventory;
- domain and DNS inventory;
- hosting inventory;
- wallet inventory;
- contract inventory;
- privileged-role inventory;
- app-store inventory;
- credentials handover register;
- testing reports;
- audit reports;
- remediation reports;
- training presentations;
- administrator training;
- technical-team training;
- operations training;
- compliance workflow training;
- recorded training sessions;
- final handover checklist;
- signed issuer-control confirmation.

The developer must demonstrate that the system can be built and deployed from a clean environment using the delivered source code and documentation.

Documentation must:

- be editable;
- be project-specific;
- match the final production system;
- contain complete operating instructions;
- contain complete updating instructions;
- contain complete deployment instructions;
- contain complete backup and recovery instructions;
- allow a qualified replacement developer or internal IT team to continue the project.

Mandatory Independent Handover Test

- Provide a clean, current export of every repository and confirm that all branches, tags and release histories are present.
- Demonstrate a complete build and deployment from a clean environment using only the delivered code and documentation.
- Demonstrate database migration, backup restoration and rollback in a non-production environment.
- Demonstrate website/CMS administration, asset and document publication, user/role management and audit-log review.
- Demonstrate smart-contract role administration, pause/unpause, mint/burn test procedures, treasury/multisig operations and contract monitoring using approved test environments.
- Demonstrate iOS and Android build, signing, TestFlight/Google Play deployment, update and rollback procedures.
- Transfer all accounts, credentials, keys, recovery codes and privileged roles through an approved secure handover process.
- Provide recorded training and editable step-by-step manuals for business administrators, operations personnel and replacement technical staff.
- Remove or disable all developer access after the owner confirms receipt and operational control.
- The project remains incomplete if ReserveChain cannot operate and maintain the ecosystem independently.

Generic manuals, empty templates, incomplete diagrams or documentation that does not match the delivered platform will not be accepted.

PHASE 22 - WARRANTY, POST-LAUNCH SUPPORT AND EXIT ASSISTANCE

The proposal must define:

- warranty period;
- bug-fix period;
- critical incident response time;
- high-severity response time;
- normal support response time;
- security patching responsibilities;
- infrastructure monitoring responsibilities;
- smart contract monitoring responsibilities;
- application update support;
- App Store resubmission support;
- Google Play resubmission support;
- CoinMarketCap follow-up support;
- CoinGecko follow-up support;
- exchange application follow-up;
- dependency updates;
- knowledge-transfer support;
- replacement-developer cooperation;
- exit assistance;
- data-export support;
- final removal of developer access;
- post-support transition process.

No vendor lock-in will be accepted.

COMMON ACCEPTANCE CRITERIA FOR EVERY PHASE

A phase will only be accepted when:

1. All agreed deliverables are complete.
2. The functionality operates in the agreed environment.
3. The source code has been committed to the issuer-controlled repository.
4. The work is connected to the rest of the ecosystem.
5. Required tests have passed.
6. Test evidence has been supplied.
7. The applicable documentation has been updated.
8. Owner inputs and external dependencies are clearly identified.
9. No undisclosed access or privileged control remains.
10. No unresolved critical defect remains.
11. The project owners can independently test the deliverable.
12. Written milestone acceptance has been issued.

Milestone payment does not waive latent defects, security defects, missing source code, undocumented access or incomplete handover obligations.

PROPOSED 90-120 DAY STRUCTURE

Days 1-15

- requirements traceability;
- architecture;
- project plan;
- UX/UI;
- website continuation;
- technology stack;
- tokenomics configuration;
- provider selection;
- security design;
- app-store strategy;
- exchange and marketing planning.

Days 16-30

- smart contract development;
- wallet and multisig structure;
- backend foundation;
- database;
- API foundation;
- website completion;
- investor portal foundation;
- admin portal foundation.

Days 31-45

- future USDT token-acquisition module;
- KYC/KYB integration;
- sanctions and jurisdiction controls;
- investor portal;
- admin workflows;
- financial ledger;
- blockchain synchronization.

Days 46-60

- industrial metals registry and asset-program management;
- Proof of Reserves;
- redemption portal;
- reporting;
- reconciliation;
- iOS development;
- Android development;
- white paper and investor-document drafting.

Days 61-75

- mobile integration;
- complete portal integration;
- testnet deployment;
- smart contract testing;
- platform QA;
- DEX preparation;
- exchange data room;
- marketing infrastructure and campaign preparation.

Days 76-90

- independent smart contract audit;
- security testing;
- remediation;
- user acceptance testing;
- TestFlight testing;
- Android internal testing;
- app-store submissions;
- CoinMarketCap/CoinGecko preparation;
- PR and community launch preparation;
- manuals and training preparation.

Days 91-120

- final testing;
- mainnet deployment;
- controlled token-acquisition module or TGE;
- DEX launch;
- reserve publication;
- app release support;
- CoinMarketCap/CoinGecko submissions as eligible;
- CEX applications;
- marketing campaign;
- final documentation;
- recorded training;
- full handover;
- post-launch monitoring.

Some phases may run in parallel, but dependencies and launch gates cannot be bypassed merely to meet a calendar date.

RESPONSE REQUIRED FROM THE DEVELOPER

Please convert these instructions into a formal milestone schedule and respond point by point.

For every phase, provide:

- phase number;
- phase name;
- start date;
- completion date;
- duration;
- assigned team members;
- technical deliverables;
- documentation deliverables;
- acceptance criteria;
- project-owner inputs;
- dependencies;
- third-party providers;
- third-party expenses;
- milestone amount;
- testing process;
- handover items;
- risks;
- exclusions;
- items dependent on external approval.

Also provide:

1. Complete requirements traceability matrix.
2. Complete technology stack.
3. Complete team structure.
4. Complete system architecture.
5. Smart contract architecture.
6. Wallet and multisig plan.
7. KYC/KYB provider recommendation.
8. Sanctions and blockchain-screening recommendation.
9. Smart contract audit firm and estimated fee.
10. Penetration testing plan.
11. Hosting and infrastructure plan.
12. iOS and Android submission plan.
13. Uniswap and liquidity plan.
14. CoinMarketCap and CoinGecko plan.
15. CEX application plan.
16. Market-maker requirements.
17. Global marketing plan.
18. USD 500 monthly marketing-retainer scope.
19. Third-party cost schedule.
20. Items included in the fixed project price.
21. Items excluded from the fixed project price.
22. Items requiring project-owner information.
23. Items requiring third-party providers.
24. Items requiring separate budget.
25. Items that cannot be guaranteed.
26. Security and QA plan.
27. Documentation plan.
28. Source-code delivery plan.
29. Training plan.
30. Warranty and support plan.
31. Issuer-control transfer plan.
32. Final handover checklist.

Do not provide a generic summary.

Do not omit any requirement from the original Freelancer project.

If you believe any requirement cannot be completed, conflicts with another requirement, requires a scope clarification or requires an additional budget, identify it specifically before proceeding.

These instructions will govern the project through final development, testing, launch, documentation, training and handover.

PART III

FINAL ACCEPTANCE, HANDOVER AND CONTROL REGISTERS

Mandatory verification before project completion or release of final acceptance

A. FINAL SYSTEM ACCEPTANCE GATES

- [] Requirements traceability: every project requirement is mapped to a delivered, tested and documented component.
- [] Prelaunch accuracy: no unsupported corporate, legal, asset, laboratory, valuation, custody, insurance, reserve, token or regulatory statement is public.
- [] Website: all approved pages, navigation, forms, multilingual architecture, CMS, accessibility, SEO, security and responsive layouts are complete.
- [] Industrial assets: Copper Powder and Nickel Wire data models, lots/batches, containers/coils, documents, statuses and Digital Asset Passports function correctly.
- [] Backend: APIs, database, blockchain synchronization, notifications, reporting, logs and administrative controls are integrated and documented.
- [] Smart contracts: source code, tests, deployment scripts, roles, multisig compatibility, pause controls, mint/burn and reconciliation logic are demonstrated in the approved environment.
- [] Portals: investor, administration, compliance, reserve and redemption modules are functional in their approved mode; inactive modules remain inaccessible and non-indexable.
- [] Mobile apps: iOS and Android applications are integrated, tested, documented and available through TestFlight and Google Play testing under ReserveChain-controlled accounts.
- [] Whitepaper: preliminary and final publication workflows, editable sources and approved final files are delivered.
- [] Security and QA: test reports, remediation evidence, vulnerability review, backup restoration and deployment/rollback tests are complete.
- [] Ownership: all repositories, infrastructure, domains, databases, accounts, wallets, app-store configurations and third-party services are controlled by ReserveChain.
- [] Documentation and training: project-specific manuals and recorded training permit independent operation and maintenance.
- [] Independent verification: the project owner or appointed reviewer has access to test all deliverables and approve or reject them.

B. OWNER-SUPPLIED OR OWNER-APPROVED INPUT REGISTER

The developer must track these inputs, their status, source, version, approval authority and affected system components. Pending inputs do not permit omission of the corresponding configurable technical structure.

Category	Required Owner Input	Status	Approval / Version
Corporate	Swiss entity name, registration, address, issuer/asset-holding structure, directors and authorized signatories	Pending / Supplied	
Legal/Regulatory	Token classification, legal opinions, eligibility rules, permitted/restricted jurisdictions, agreements, disclosures and final legal text	Pending / Supplied	
Industrial Assets	Ownership/title, origin, quantities, batches/containers/coils, technical specifications, photographs and supporting records	Pending / Supplied	
Laboratory/ Inspection	Certificates of Analysis, purity reports, assay/testing reports and inspections	Pending / Supplied	
Valuation/ Commercial	Independent valuations, approved pricing, token supply, ratios, allocations, fees, use of funds and financial assumptions	Pending / Supplied	
Custody/Insurance	Custodian, warehouse, agreements, receipts, insurance provider, policy and approved coverage statements	Pending / Supplied	
Proof of Reserves	Approved methodology, attestations, reconciliation inputs, publication schedule and authorized reports	Pending / Supplied	
Brand/Content	Approved logo, official contacts, biographies, partners, images, translations and public announcements	Pending / Supplied	
Launch	Written activation authorization, approved contracts, treasury/multisig participants, budgets and launch schedule	Pending / Supplied	

C. MANDATORY HANDOVER INVENTORY

Source and Build

- All website, frontend, backend, API, portal, smart-contract, iOS and Android source code
- Complete Git history, branches, tags, releases, build scripts, deployment scripts and automated tests
- Database schema, migrations, seeds/test fixtures and data-export/import tools
- Contract ABIs, verified source, deployment records and network/configuration inventory

Accounts and Control

- Repositories, hosting/cloud, domains, DNS, databases, storage, email, analytics, monitoring and third-party services
- Wallets, multisig configurations, contract roles, recovery procedures and privileged-role inventory
- Apple Developer, App Store Connect, Google Play Console, Firebase, push notifications, signing and upload-key control
- Credentials, recovery codes and secure access register transferred to ReserveChain

Manuals

- System architecture and infrastructure
- Website, CMS, portals and content publication
- Industrial Metals Registry and Digital Asset Passports
- Smart contracts, token roles, mint/burn/pause, treasury and multisig
- KYC/KYB, jurisdiction, compliance and user administration
- Proof of Reserves, reconciliation and redemption
- iOS and Android build, signing, testing, store publication and updates
- DevOps, deployment, rollback, backup, restoration, disaster recovery and incident response
- Security, monitoring, analytics, email, DNS and troubleshooting

Training and Evidence

- Recorded administrator, operations and technical training
- Testing, security, audit, remediation and performance reports
- Store submissions, app-testing access and publication records
- Known-issues register, warranty/support plan and replacement-developer transition plan

No Vendor Lock-In

The final milestone must not be accepted while any essential source code, account, credential, signing asset, private key, configuration, deployment procedure, documentation or operational knowledge remains exclusively controlled by the developer.

D. DEVELOPER ACKNOWLEDGEMENT AND ACCEPTANCE OF SCOPE

By signing below, the developer or development company confirms that it has reviewed this document, the project description, attachments, memoranda and written instructions; understands the separation between developer responsibilities and owner/third-party inputs; and accepts that no requirement is complete until implemented, deployed, tested, documented and formally accepted.

Final Acceptance Date	

Final Binding Statement

This document is the consolidated execution direction for the assigned ReserveChain.io developer. It covers the prelaunch website, backend, portals, industrial-metals registry, Digital Asset Passports, ERC-20 token architecture, mobile applications, whitepaper, testing, deployment, documentation, training and handover. No requirement may be treated as completed until it is implemented, tested, documented, independently verifiable and formally accepted by the project owner.
